

There was a good conversation regarding how NFTs are sub-optimal for verifiable credentials in Self-Sovereign Identity use cases:

[

](<https://www.youtube.com/watch?v=qEjgl2nVLb0>)

Most of the points made were in reference to NFTs on Ethereum and their lack of privacy. I expect that many of the points made against NFTs for verifiable credentials would not apply to Secret NFTs on the Secret Network.

Is anyone aware of a prototype example (or paper) of Secret NFTs for verifiable credentials? Would Secret NFTs used as verifiable credential properly address the concerns mentioned in the above interview?

My initial thought is that Secret NFTs would be an ideal approach for Self-Sovereign Identity use cases. Let me know if you think that thought is misplaced.
