

To the Community,

We present a proposal to collaboratively execute Proposals 288 and 259, aiming for a resolution that benefits all parties and the community at large.

- Collaborative Execution under [Secret.express](#): The execution of these proposals will proceed under the existing endpoint [Secret.express](#). This approach ensures the continuity and stability of services.
- Node Management Flexibility: Secret Saturn, and Taariq will have the autonomy to adjust their node counts as needed (not exceeding 9 each), ensuring optimal performance and resource allocation. Under this plan:
- Taariq, in line with Proposal 259, will continue to manage nine or fewer nodes at his discretion.
- Alex, following Proposal 288, will similarly handle nine or fewer nodes, maintaining the freedom to adjust as necessary.
- Taariq, in line with Proposal 259, will continue to manage nine or fewer nodes at his discretion.
- Alex, following Proposal 288, will similarly handle nine or fewer nodes, maintaining the freedom to adjust as necessary.
- Resource Allocation: The arrangement ensures that all parties are compensated in accordance with 288 and amendments to 259, aligning with their contributions and operational costs. Delta Flyer LLC, will receive payments equivalent to the management of nine nodes until the projected end in March. This payment represents an open-sourcing fee, but in reality covers community infrastructure costs associated with the wind down commitments to space that houses community APIs. Importantly, while this fee does not cover development costs, Delta Flyer, LLC will still deliver open-source code as specified.
- Open Source Contribution: As part of this agreement, Delta Flyer LLC will contribute specific developed tools as open-source (AGPL) which saturn is free to modify as per 288 deliverables state. We believe this contribution enriches the community's, and cosmos, toolset.

This proposal is crafted with the objective of ensuring a harmonious and effective resolution of previous disagreements, and it seeks to establish a foundation for continued cooperation and mutual benefit. It is an acknowledgment of the diverse roles and contributions from public API providers and a commitment to moving forward in a spirit of unity and shared purpose.

Software Deliverables for Secret Express

Secret Express is an open-source tool designed for efficient cluster node health management, specifically tailored for Cosmos SDK and CometBFT nodes. This application ensures automated monitoring and maintenance of node health, featuring capabilities such as real-time health checks, automated removal of unhealthy nodes, and ease of seamless integration with various load balancers. As part of the deliverables for this proposal, Secret Express is provided with documentation and source code. These deliverables are accessible through the links provided, offering a comprehensive overview and easy access to the software for community use and further development.
