

Suppose that you supply 10 USDT in the day 1

This implies create a tx where you send 10 USDT

and receive 10 aPolUSDT

On day 365 in the dashboard you can see that now you have 11 USDT (10% APY) and want withdraw all.

Then a transactions that call withdrawal method is created, you send 10 aPolUSDT

and receive 11 USDT

, how this 1USDT of interest is calculated?

For a more real example see this tx [0x5bcb11579fa60fa55ba83bdc0140aa9bafaa493d85cdb899a65a463551206871](https://etherscan.io/tx/0x5bcb11579fa60fa55ba83bdc0140aa9bafaa493d85cdb899a65a463551206871), send 3.202497 aPolUSDT and receive 3.20501 USDT how the 0.00251 of interest is calculated?

Thanks!
