

a malicious smart contract has taken over my ETH account and is draining funds from my account as soon as you send some. I need to submit a transaction where someone else is the sponsor for your tx (for fees). Then perform the transaction as per normal. The bundle is submitted to the flashbots rpc as opposed to only a normal RPC node though, to make sure it can't be frontrun either. Can I use MetaMask rpc to execute this transaction because I don't have a knowledge about python
