## Description

Search for a keyword across the metadata of all ERC-721 and ERC-1155 smart contracts.

Currently in BETA

This endpoint is currently in BETA. Please report any feedback you have for this endpoint via [Alchemy's discord](#) .

## Parameters

Name Type Description query string The search string that you want to search for in contract metadata.

## Response

Property Type Description Promise object An object containing a contracts array property that returns nft metadata.

### SearchContractMetadataResponse

object properties

Property Type Description tokenType string The type of token in the contract. Options are: ERC721 = "ERC721", ERC1155 = "ERC1155", UNKNOWN = "UNKNOWN" address string The address of the NFT contract. name string The name of the contract. symbol string The symbol of the contract. totalSupply string The number of NFTs in the contract as an integer string. This field is only available on ERC-721 contracts. openSeaMetadata object OpenSea's metadata for the contract. Parameters include:

1. floorPrice?: number : The floor price of the collection. 2. collectionName?: string : The name of the collection on OpenSea. 3. safelistRequestStatus?: string : The approval status of the collection on OpenSea. 4. imageUrl?: string : The image URL determined by OpenSea. 5. description?: string : The description of the collection on OpenSea. 6. externalUrl?: string : The homepage of the collection as determined by OpenSea. 7. twitterUsername?: string : The Twitter handle of the collection. 8. discordUrl?: string : The Discord URL of the collection. 9. lastIngestedAt: string : Timestamp of when Alchemy last ingested the OpenSea metadata. contractDeployer string The address that deployed the NFT contract. deployedBlockNumber number The block number the NFT contract deployed in.

## Example Request and Response

Prerequisite : You will need to install the Alchemy SDK before making requests with it.

The commands for installing it using npm or yarn are given below:

```
npm yarn npm install alchemy-sdk@latest yarn add alchemy-sdk@latest
```

### Request

```
index.js // Imports the Alchemy SDK const {Alchemy ,Network }= require ("alchemy-sdk");// Configures the Alchemy SDK const config = {apiKey : "alchemy-replit" ,// Replace with your API key network :Network .ETH_MAINNET ,// Replace with your network };// Creates an Alchemy object instance with the config to use for making requests const alchemy = new Alchemy (config );const main = async ()=> {const kw = "hair" //Call the method to fetch metadata const response = await alchemy .nft .searchContractMetadata (kw )//Logging the response to the console console .log (response ) };main ();
```

### Response

```

## Code Sandbox

You can test out the `searchContractMetadata` method using the code sandbox below:

## Use Cases

Here are some potential use cases for the `searchContractMetadata` method:

- Finding relevant smart contracts
- : If you are looking for a particular smart contract to interact with on a blockchain network, you can use `searchContractMetadata`
- to find contracts that match certain metadata criteria, such as contract name, author, or version.
- Analyzing smart contract usage
- : Blockchain networks allow for the deployment of multiple instances of the same smart contract, each with its own metadata. `searchContractMetadata`
- can be used to analyze metadata from various instances of a particular contract to gain insights into its usage patterns and adoption rates.
- Auditing smart contracts
- : Smart contracts are self-executing and can be complex, making them susceptible to bugs and vulnerabilities. `searchContractMetadata`
- can be used to audit the metadata associated with a particular smart contract to ensure that it is trustworthy and secure.

## Related Methods

- [getNftMetadata](#)
- : Get the NFT metadata associated with the provided parameters.
- [getNftMetadataBatch](#)
- : Gets the NFT metadata for multiple NFT tokens.
