

Hi guys,

Been reading through the docs and on the buildingonarbitrum/tokenbridging section it was mentioned that essentially any type of token contract. Ive also taken a look at the token-bridges contracts and noticed the ITransferAndCall lib was only supporting erc20 tokens, was wondering if there is support for erc721. I'm currently building a project on arbitrum but want to have the ability to move tokens between chains.

I also tried reddit but the only plausible post i found was this one

[reddit](#)

[**r/Arbitrum - Bridging ERC-721? NFT bridging**](#)

3 votes and 1 comment so far on Reddit

this method would work for sure but it would require me to fractionalize the nft, which i don't really like the idea for doing for my particular usecase.

If someone could point me to a setup similar to the ICustomToken and or IArbToken interfaces but for erc721 that would be much abliged.

Many thanks.
