

Hi,

I was curious if it was still possible to run multiple nodes on the network in the new release, I don't see any option to do it.

I also had errors concerning the txt file containing the deployed contract address which is supposed to be created at migration. For example :

Deploying Secret Contract "simple\_addition.wasm"...

Smart Contract "Sample.Sol" has been deployed at ETH address: 0x4cFB3F70BF6a80397C2e634e5bDd85BC0bb189EE

Completed. Final Task Status is 2

Secret Contract "simple\_addition.wasm" deployed at Enigma address:  
0x2822d89771ad2e375fcad20340901c716925c343a48e82a864d17274136f8a25

```
{ [Error: ENOENT: no such file or directory, open '../test/simple_addition.txt']
```

```
errno: -2,
```

```
code: 'ENOENT',
```

```
syscall: 'open',
```

```
path: '../test/simple_addition.txt' }
```

If a line to create the file and write the address within it not added in the deploy script, the tests fails. I'm running the discovery cli from the main directory.
