

Endpoints

Currently, the Router API has only two simple endpoints:

- GET /v1/shortcuts/route
- - Get an easy-to-submit bytecode to go from a token to another, including LPs and DeFi positions. Returns a transaction that can be submitted to an Ethereum node.
- GET /v1/shortcuts/quote
- - Get a quote from one token to another.

Authentication

Enso authenticates your API requests using your account's API keys. Getting an API key is easy, and you can create as many as you need from the Enso developers[portal\(opens in a new tab\)](#).
