

I've been exploring ways to launch an Enigma enabled node (particularly the Dockerized one) on a cloud in order to try to deploy online the [Secret Rock, Papers and Scissors](#) project. Although it can be tested locally, I feel an online example would be a great way to interact and showcase such work.

However, none of the most common providers (i.e. AWS, Google Cloud, Azure) have SGX-enabled machines, making it almost impossible to test it online. Intel Bluemix provides [some ways to launch some](#), but they are expensive

to say the least.

Does anyone know any way we could test an enigma node online within a cloud setup that doesn't break the wallet?
