

Trigger Types

1. Time Interval

Use this trigger to execute tasks at regular intervals, e.g., every 10 minutes or once every 24 hours. It's like setting a straightforward, recurring alarm.

1. Cron Expressions

This offers a more refined control compared to the Time Interval. With [cron expressions](#), you can set tasks to run at specific moments, such as "every Tuesday at 3 PM" or "on the 1st of every month". It gives you precision in task scheduling.

1. On-Chain Event

Ideal for those wanting their tasks to respond dynamically to blockchain activities. Whenever a specified event occurs on the blockchain, e.g.

...

Copy //event creation with argument types and names `eventownerChanged(addressindexed_from,addressindexed_to);`

...

this trigger springs your task into action.

1. Every Block

This function operates with the rhythm of the blockchain itself, executing your chosen function each time a new block is created.

Note : Irrespective of the trigger type you opt for, you can tie it to running any of the following:

- Typescript Function
- Solidity Function
- Transaction
-
