

Hi! My name is Andrew.

I am a software developer and am learning about web3 and Blockchain, specifically for Ethereum based chains.

I have a specific issue that I am hoping someone here can help me with...

1. I use PulseChain, an Ethereum fork started in May 2023, Chain Id 369.
2. Due to my own stupidity/carelessness, I believe (though I'm not entirely sure) that one of my wallets was compromised (seed phrase exposed).
3. The wallet is now empty except that it was used to initiate a stake...
4. The stake ends in a few months, so I am concerned that a monitoring bot will automatically transfer my coins...
5. Someone suggested that with Flashbots I can create a JavaScript that will bundle multiple transactions (ie. unlock stake and transfer coins to a safe wallet) so that they are included into a single block and thus preventing them being stolen...

Is the above correct?

I saw something about a flashbots RPC...will that support PulseChain?

Can someone in the community assist me?
