

seid tx multisign

Sign transactions created with the `--generate-only` flag that require multisig signatures.

Read one or more signatures from one or more [signature] file, generate a multisig signature compliant to the multisig key [name], and attach the key name to the transaction read from [file].

Example: `tx multisign transaction.json k1k2k3 k1sig.json k2sig.json k3sig.json`

If `--signature-only` flag is on, output a JSON representation of only the generated signature.

If the `--offline` flag is on, the client will not reach out to an external node. Account number or sequence number lookups are not performed so you must set these parameters manually.

The current multisig implementation defaults to amino-json sign mode. The `SIGN_MODE_DIRECT` sign mode is not supported.'

Usage: `seid tx multisign [file] [name] [[signature]...] [flags]`

Flags: `-a`, `--account-number` uint The account number of the signing account (offline mode only) `--amino` Generate Amino-encoded JSON suitable for submitting to the txs REST endpoint `-b`, `--broadcast-mode` string Transaction broadcasting mode (sync|async|block) (default "sync") `--chain-id` string network chain ID `--dry-run` ignore the `--gas` flag and perform a simulation of a transaction, but don't broadcast it (when enabled, the local Keybase is not accessible) `--fee-account` string Fee account pays fees for the transaction instead of deducting from the signer `--fees` string Fees to pay along with transaction; eg: 10uatom `--from` string Name or address of private key with which to sign `--gas` string gas limit to set per-transaction; set to "auto" to calculate sufficient gas automatically (default 200000) `--gas-adjustment` float adjustment factor to be multiplied against the estimate returned by the tx simulation; if the gas limit is set manually this flag is ignored (default 1) `--gas-prices` string Gas prices in decimal format to determine the transaction fee (e.g. 0.1uatom) `--generate-only` Build an unsigned transaction and write it to STDOUT (when enabled, the local Keybase only accessed when providing a key name) `-h`, `--help` help for multisign `--keyring-backend` string Select keyring's backend (os|file|kwallet|pass|test|memory) (default "os") `--keyring-dir` string The client Keyring directory; if omitted, the default 'home' directory will be used `--ledger` Use a connected Ledger device `--node` string : to tendermint rpc interface for this chain (default "tcp://localhost:26657") `--note` string Note to add a description to the transaction (previously `--memo`) `--offline` Offline mode (does not allow any online functionality) `-o`, `--output` string Output format (text|json) (default "json") `--output-document` string The document is written to the given file instead of STDOUT `-s`, `--sequence` uint The sequence number of the signing account (offline mode only) `--sign-mode` string Choose sign mode (direct|amino-json), this is an advanced feature `--signature-only` Print only the generated signature, then exit `--timeout-height` uint Set a block timeout height to prevent the tx from being committed past a certain height `-y`, `--yes` Skip tx broadcasting prompt confirmation

Global Flags: `--home` string directory for config and data (default "~/.sei") `--log_format` string The logging format (json|plain) `-log_level` string The logging level (trace|debug|info|warn|error|fatal|panic) `--trace` print out full stack trace on errors Last updated on July 1, 2024 [upgrade oracle](#)
