

I saw someone post in Telegram about using secretTokens and ibc/tokens for fees as a UX improvements and after some time this is my thoughts:

Correct me if i'm wrong but this should be fairly easy to implement after supernova, we can just merge in the logic from Terra which is able to use it's stablecoins as transaction fees; it also seems to be able to use ibc/tokens too.

This would be a massive UX improvement for new wallets in the ecosystem, but the downside might be less utility for the SCRT token and Keplr dose not support this either.

We would have to whitelist these though which I don't think Terra has yet.

What dose everyone think of this idea?
