

Over on the chat, someone said `integration_test_7` switched to new (“super massive”) data on round 282, and then... switched back? Weird, if true.

Perhaps you could compare performance of “`integration_test_N`” (for every “N”) against performance of `example_predictions.csv` (legacy version, and super-massive version). Just use 2 of your 50 model slots, to submit those (unstaked) from your account.

Or instead of `example_predictions.csv`, you could run the example code that’s supposed to produce it.

Of course, if you were doing that, you would no longer need

`integration_test_whatever`.
