

Name:

Modular Wallet (https://twitter.com/modular_wallet)

Project:

GMX Trading Module

About us:

Modular is a self-custodial wallet with modular framework, built natively on Arbitrum and powered by \$MOD. Within different modules, users can interact directly with protocols within a tap.

Android:

<https://play.google.com/store/apps/details?id=com.modular>

iOS:

<https://testflight.apple.com/join/Zbf6wZaP>

Detailed Description of Project:

Modular will provide an ad-hoc development and further maintenance of the GMX Module. The development will include all the features and functionalities the desktop app currently has (included V2 update). Users will interact simultaneously with both desktop and mobile on a fully interoperable and decentralized way (Modular and Metamask are compatible and can be used in tandem). The UX will be CEX-like mobile apps.

How will your project benefit the GMX Ecosystem?

There are currently no Arbitrum mobile apps for GMX besides embedded-browser on several non-native wallets. Users will be able to manage their positions on-the-go, without the need of a laptop to interact with the protocol. Moreover, a mobile experience will attract new users from emerging markets that don't have a laptop to use the protocol. A native experience gives more adoption, hence, more revenue.

Implementation Overview:

- V2

and V1

functionalities that are not implemented yet: 850 GMX

(or the equivalent USDC

at current market rate)

- Own technical and legal infrastructure for 24/7 mobile availability worldwide: 10 GMX

on a monthly basis.
