

Access IPFS content

Access files on the IPFS network with gateways.

[IPFS Gateways](#) are HTTP-based services that access content residing on the IPFS network. They provide workarounds for applications - such as browsers, curl, and wget - that have no native support for IPFS.

For example, errors may occur when an application that does not support IPFS attempts to access content in the canonical form:

ipfs:/// A solution is to use a custom-built private gateway or an Infura project-specific dedicated gateway.

info * [Content identifiers](#) * must use CIDv1 (not CIDv0) because some browsers * and user agents force lowercase for the authority part of URLs. * The Infura IPFS public gateway was deprecated on August 10, 2022.
