

Hello everyone !

I was wondering if someone would be able to explain to me how the connection of a wallet to the aave protocol works ?

Which information about our wallet does Aave see ? and store if it's the case ?

And does the browser can see some info as well

? in case of a malware ?

I would like to connect my ledger wallet, but I want to be sure in advance that no one would be able, by any means, to access some info that would allow them to empty my ledger wallet

Thanks in advance,

have a great day !

Lucas
