

There are many instances where smart contracts are eligible for the retroactive airdrop however the claim itself cannot be withdrawn due to the lack of the necessary logic.

I would like discuss adjusting the claim data/logic to make contract deployers eligible for the necessary subset of the unclaimed addresses. This would not add any additional claims above those which are already allocated.

I am not yet sure of the feasibility of this proposal however I have the experience and skills to follow this proposal through should it garner enough interest / delegation.

Thoughts everyone?

I look forward to discussing this further with the community
