

I read the token whitepaper and got a few question:

1. Why does eigen also need to fork to have a solid representation?
2. I presume there should be a major assumption that deflationary tokens will rise? whether they rise depends on the buying pressure, the quantity of deflationary tokens may decrease but the value may not remain unchanged. Am I getting anything wrong?
3. If one AVS is under attack, will all AVS burn together? and they replace EIGEN together?
4. Will AVS have its own governance? Will it participate in the security council?
