

To make long term value accrual , it's must that , whales don't farm all the tokens and dump on retail users in Centralised exchanges.

To prevent this

1- UNI liquidity pool with liquidity rewards must be created with major rewards going to UNI pool

2- Small liquidity providers( say providing liquidity below 1000usd) must be incentivised and a fix number of tokens kept for them , also it needs to mentioned that some mechanism to protect Sybil attack must be done to do this safely

3- partner with yearn and other good ecosystem projects to to grow more utility

4- Make governance gasless and apply quadratic Voting to nullify whale attack

Please if you like my idea , comment hail Uniswap

and like and suggest improvements on above.

Also any generous person put this proposal as I don't know how to do it.

Thanks , Hail Uniswap
