

Looking to understand the protocol emission of the AAVE network, willing to pay AAVE for a one on one history lesson and current state of the practice

I have gotten some insight by looking at the discussions on governance.aave.com site, however I need an OG to give me straight understandable information on the following:

- The genesis and initial logic of necessity behind the Aave Protocol Emissions (why did it need to exist for the protocol to be a success)
- How it started up initially (with actual calcs)
- Where is it today (with actual calcs also)
- What do you suspect the community would have done differently from the beginning
