

Automation of JSON formatting of Element Analysis + FacilitatorDAO Action Examples

We have updated our GitHub repository at [GitHub - Flowercorn/atlas](#) with a new script named maker_notion.py. Additionally, we've refreshed the README file to provide concise instructions for those looking to expand their operations.

The newly introduced script enables users to input plain text into a Notion database and then convert it into the JSON format that the Atlas utilizes. In addition it integrates the work done into the atlas file we developed previously in the right places.

Our commitment to maintaining our work as open-source remains steadfast, facilitating the scaling of your endeavors.

Should you prefer to avoid the technicalities involved in setting up your database and interacting with the scripts, feel free to DM us here, on Discord or at [\[email protected\]](#)

[\]\(/cdn-cgi/l/email-protection#0f696360786a7d6c607d614f7f7d607b606121626a\)](#)). We can grant you direct access to submit your contributions to our database, ensuring a seamless transformation process.

We trust that these developments will streamline your workflow, allowing you to excel in the analytical governance work you are passionate about. By making the process more accessible, we invite a broader spectrum of talent to contribute and thrive.
