

Introduction

warning We are excited to announce that the Band V3 is currently under development!

During this period, you may encounter intermittent updates, changes, and limited availability as we work to enhance its features and performance.

We appreciate your patience and understanding as we aim to deliver a robust and improved testing experience. Stay tuned for more updates and release information! BandChain V3 has native threshold signature scheme (TSS) built into the system. The TSS module facilitate data verification with minimal computation and gas required compared to traditional method such as multi-signature.

This section explains how TSS works in BandChain and how a user interact with the blockchain to request a TSS signature to verify data on BandChain on another blockchain system. [Previous Axelar Integration](#) [Next BandChain TSS Group](#)
