

Is this a reasonable breakdown of possible validator states (in Casper FFG):

1. In the validator set (for this epoch), and actively voting each round (ie, on each block)
2. In the validator set, but currently not voting, eg, lost connection (and therefore supposed to gradually lose "voting weight"? But i don't see this in the code below)
3. Not in the validator set: "logged out", but hasn't yet withdrawn deposit so can still log back in (how?) & resume voting
4. Not in the validator set: already withdrew deposit, can no longer rejoin

About #3

, I couldn't make out how to "log back in" in

https://github.com/ethereum/casper/blob/master/casper/contracts/simple_casper.v.py. There's a `logout()`, but no `login()` - the comment for `logout()` says "Log in or log out from the validator set"...
