

Using DON-hosted Secrets in Requests

This tutorial shows you how to send a request to a Decentralized Oracle Network to call the [Coinmarketcap API](#) . After [OCR](#) completes offchain computation and aggregation, it returns theBTC/USDasset price to your smart contract. Because the API requires you to provide an API key, this guide will also show you how to encrypt, sign your API key, and share the encrypted secret with a Decentralized Oracle Network (DON).

The encrypted secrets are never stored onchain. This tutorial uses the threshold encryption feature. The encrypted secrets are stored with the DON. Read the [Secrets Management page](#) to learn more.

caution

Chainlink Functions is still in BETA. The use of secrets in your requests is an experimental feature that may not operate as expected and is subject to change. Use of this feature is at your own risk and may result in unexpected errors, possible revealing of the secret as new versions are released, or other issues.

note

Chainlink Functions is a self-service solution. You must ensure that the data sources or APIs specified in requests are of sufficient quality and have the proper availability for your use case. You are responsible for complying with the licensing agreements for all data providers that you connect with through Chainlink Functions. Violations of data provider licensing agreements or the [terms](#) can result in suspension or termination of your Chainlink Functions account.

Prerequisites

note

You might skip these prerequisites if you have followed one of these [guides](#) . You can check your subscription details (including the balance in LINK) in the [Chainlink Functions Subscription Manager](#) . If your subscription runs out of LINK, follow the [Fund a Subscription](#) guide.

Set up your environment

You must provide the private key from a testnet wallet to run the examples in this documentation. Install a Web3 wallet, configure [Node.js](#) , clone the [smartcontractkit/smart-contract-examples](#) repository, and configure a.env.encfile with the required environment variables.

Install and configure your Web3 wallet for Polygon Mumbai:

1. [Install Deno](#) so you can compile and simulate your Functions source code on your local machine.
2. [Install the MetaMask wallet](#) or other Ethereum Web3 wallet.
3. Set the network for your wallet to the Polygon Mumbai testnet. If you need to add Mumbai to your wallet, you can find the chain ID and the LINK token contract address on the [LINK Token Contracts](#) page.
4. [Polygon Mumbai testnet and LINK token contract](#)
5. Request testnet MATIC from the [Polygon Faucet](#) .
6. Request testnet LINK from [faucets.chain.link/mumbai](#) .

Install the required frameworks and dependencies:

1. [Install the latest release of Node.js 20](#) . Optionally, you can use the [nvm package](#) to switch between Node.js versions withnvm use 20.

Note: To ensure you are running the correct version in a terminal, typenode -v.

node-v\$node-vv20.9.0.2. In a terminal, clone the [smart-contract-examples](#) repository and change directories. This example repository imports the [Chainlink Functions Toolkit NPM package](#) . You can import this package to your own projects to enable them to work with Chainlink Functions.

gitclone https://github.com/smartcontractkit/smart-contract-examples.git&&cd./smart-contract-examples/functions-examples/. Runnpm installto install the dependencies.

npminstall 4. For higher security, the examples repository encrypts your environment variables at rest.

1. Set an encryption password for your environment variables.

npx env-enc set-pw 2. Runnpmx env-enc setto configure a.env.encfile with the basic variables that you need to send your requests to the Polygon Mumbai network.

- POLYGON_MUMBAI_RPC_URL: Set a URL for the Polygon Mumbai testnet. You can sign up for a personal endpoint from [Alchemy Infura](#) , or another node provider service.
- PRIVATE_KEY: Find the private key for your testnet wallet. If you use MetaMask, follow the instructions [to Export a Private Key](#) .Note: Your private key is needed to sign any transactions you make such as making requests.

npx env-encset

Configure your onchain resources

After you configure your local environment, configure some onchain resources to process your requests, receive the responses, and pay for the work done by the DON.

Deploy a Functions consumer contract onPolygon Mumbai

1. [Open the FunctionsConsumerExample.sol contract](#) in Remix.

[Open in Remix](#) [What is Remix?](#) 2. Compile the contract. 3. Open MetaMask and select thePolygon Mumbainetwork. 4. In Remix under theDeploy & Run Transactionstab, selectInjected Provider - MetaMaskin theEnvironmentlist. Remix will use the MetaMask wallet to communicate withPolygon Mumbai. 5. Under theDeploysection, fill in the router address for your specific blockchain. You can find both of these addresses on the [Supported Networks](#) page. ForPolygon Mumbai, the router address is0x6E2dc0F9DB014aE19888F539E59285D2Ea04244C. 6. Click theDeploybutton to deploy the contract. MetaMask prompts you to confirm the transaction. Check the transaction details to make sure you are deploying the contract toPolygon Mumbai. 7. After you confirm the transaction, the contract address appears in theDeployed Contractslist. Copy the contract address.

Create a subscription

Follow the [Managing Functions Subscriptions](#) guide to accept the Chainlink Functions Terms of Service (ToS), create a subscription, fund it, then add your consumer contract address to it.

You can find the Chainlink Functions Subscription Manager at [functions.chain.link](#) .

Tutorial

This tutorial is configured to get theBTC/USDprice with a request that requires API keys. For a detailed explanation of the code example, read the [Examine the code](#) section.

You can locate the scripts used in this tutorial in the [examples/5-use-secrets-threshold](#) directory .

1. Get a free API key from [CoinMarketCap](#) and note your API key.
2. Runnpmx env-enc setto add an encryptedCOINMARKETCAP_API_KEYto your.env.encfile.

npx env-encset 3. Make sure your subscription has enough LINK to pay for your requests. Also, you must maintain a minimum balance to upload encrypted secrets to the DON (Read the [minimum balance for uploading encrypted secrets section](#) to learn more). You can check your subscription details (including the balance in LINK) in the [Chainlink Functions Subscription Manager](#) . If your subscription runs out of LINK, follow the [Fund a Subscription](#) guide. This guide recommends maintaining at least 2 LINK within your subscription.

To run the example:

1. Open the filerequest.js, which is located in the5-use-secrets-thresholdfolder.
2. Replace the consumer contract address and the subscription ID with your own values.

constconsumerAddress="0x8dF78B7EE3128D00E90611FBeD20A71397064D99"// REPLACE this with your Functions consumer addressconstsubscriptionId=3// REPLACE this with your subscription ID 3. Make a request:

nodeexamples/5-use-secrets-threshold/request.jsThe script runs your function in a sandbox environment before making an onchain transaction:

\$ node examples/5-use-secrets-threshold/request.js secp256k1 unavailable, reverting to browser version Start simulation... Performing simulation with the following versions: deno 1.36.3 (release, aarch64-apple-darwin) v8 11.6.189.12 typescript 5.1.6

Simulation result { capturedTerminalOutput: 'Price: 25878.20 USD\n', responseBytesHexString: '0x00277cac' } ✓ Decoded response to uint256: 2587820n

Estimate request costs... Duplicate definition of Transfer (Transfer(address,address,uint256,bytes), Transfer(address,address,uint256)) Fulfillment cost estimated to 0.000000000000215 LINK

Make request... Upload encrypted secret to gateways https://01.functions-gateway.testnet.chain.link/user. StorageSlotId 0. Expiration in minutes: 15

✓ Secrets uploaded properly to gateways https://01.functions-gateway.testnet.chain.link/user! Gateways response: { version: 1693826965, success: true }

✓ Functions request sent! Transaction hash 0xfc741bb611fe4a8f2af3e40bb959d65d0f7159a5487f3c34c5500e52f9cf028e. Waiting for a response... See your request in the explorer https://mumbai.polygonscan.com/tx/0xfc741bb611fe4a8f2af3e40bb959d65d0f7159a5487f3c34c5500e52f9cf028e

✓ Request 0xbb73c5b9748f8c2434310ceb525f29f3b0e479e90f5863496f0db7c4781d2db5 fulfilled with code: 0. Cost is 0.000037474891791426 LINK. Complete response: { requestId: '0xbb73c5b9748f8c2434310ceb525f29f3b0e479e90f5863496f0db7c4781d2db5', subscriptionId: 3, totalCostInJuels: 37474891791426n, responseBytesHexString: '0x00277b7a', errorString: '', returnDataBytesHexString: '0x', fulfillmentCode: 0 }

✓ Decoded response to uint256: 2587514n
The output of the example gives you the following information:

- Your request is first run on a sandbox environment to ensure it is correctly configured.
- The fulfillment costs are estimated before making the request.
- The encrypted secrets were uploaded to the secrets endpoint https://01.functions-gateway.testnet.chain.link/user.
- Your request was successfully sent to Chainlink Functions. The transaction in this example is [0xfc741bb611fe4a8f2af3e40bb959d65d0f7159a5487f3c34c5500e52f9cf028e](https://mumbai.polygonscan.com/tx/0xfc741bb611fe4a8f2af3e40bb959d65d0f7159a5487f3c34c5500e52f9cf028e) and the request ID is 0xbb73c5b9748f8c2434310ceb525f29f3b0e479e90f5863496f0db7c4781d2db5.
- The DON successfully fulfilled your request. The total cost was: 0.000037474891791426 LINK.
- The consumer contract received a response in bytes with a value of 0x00277b7a. Decoding it offchain to uint256 gives you a result: 2587514.

            else if(donHostedSecretsVersion > 0) req.addDONHostedSecrets(donHostedSecretsSlotId, donHostedSecretsVersion);
            if(args.length > 0) req.setArgs(args);
            if(bytesArgs.length > 0) req.setBytesArgs(bytesArgs);
            s_lastRequestId = _sendRequest(request, subscriptionId, gasLimit, donId);
            return s_lastRequestId;
        });
        /* @notice Store latest result/error * @param requestId The request ID, returned by sendRequest() * @param response Aggregated response from the user code * @param err Aggregated error from the user code or from the execution pipeline * Either response or error parameter will be set, but never both */
        function fulfillRequest(bytes32 requestId, bytes memory response, bytes memory err) internal override {
            if(s_lastRequestId != requestId) {
                revert UnexpectedRequestId(requestId);
            }
            s_lastResponse = response;
            s_lastError = err;
            emit Response(requestId, s_lastResponse, s_lastError);
        }
        /* Open in Remix What is Remix? * To write a Chainlink Functions consumer contract, your contract must import FunctionsClient.sol and FunctionsRequest.sol. You can read the API references FunctionsClient and FunctionsRequest.
```

These contracts are available in an NPM package, so you can import them from within your project.

```
import {FunctionsClient} from "@chainlink/contracts/src/v0.8/functions/v1_0_0/FunctionsClient.sol";
import {FunctionsRequest} from "@chainlink/contracts/src/v0.8/functions/v1_0_0/libraries/FunctionsRequest.sol";
* Use the FunctionsRequest.sol library to get all the functions needed for building a Chainlink Functions request.
```

using FunctionsRequest for FunctionsRequest.Request; * The latest request id, latest received response, and latest received error (if any) are defined as state variables:

bytes32 public s_lastRequestId; bytes public s_lastResponse; bytes public s_lastError; * We define the Response event that your smart contract will emit during the callback

event Response(bytes32 indexed requestId, bytes response, bytes err); * Pass the router address for your network when you deploy the contract:

constructor(address router) FunctionsClient(router) * The three remaining functions are:

- sendRequest for sending a request. It receives the JavaScript source code, encrypted secretsUrls (in case the encrypted secrets are hosted by the user), DON hosted secrets slot id and version (in case the encrypted secrets are hosted by the DON), list of arguments to pass to the source code, subscription id, and callback gas limit as parameters. Then:
- It uses the FunctionsRequest library to initialize the request and add any passed encrypted secrets reference or arguments. You can read the API Reference for [initializing a request](#), [adding user hosted secrets](#), [adding DON hosted secrets](#), [adding arguments](#), and [adding bytes arguments](#).

FunctionsRequest.Request memory req; req.initializeRequestForInlineJavaScript(source); if (encryptedSecretsUrls.length > 0) req.addSecretsReference(encryptedSecretsUrls); else if (donHostedSecretsVersion > 0) { req.addDONHostedSecrets(donHostedSecretsSlotId, donHostedSecretsVersion); } if (args.length > 0) req.setArgs(args); if (bytesArgs.length > 0) req.setBytesArgs(bytesArgs); * It sends the request to the router by calling the FunctionsClient.sendRequest function. You can read the API reference for [sending a request](#). Finally, it stores the request id in s_lastRequestId then return it.

s_lastRequestId = _sendRequest(req.encodeCBOR(), subscriptionId, gasLimit, jobId); return s_lastRequestId; Note: _sendRequest accepts requests encoded in bytes. Therefore, you must encode it using [encodeCBOR](#). * sendRequestCBOR for sending a request already encoded in bytes. It receives the request object encoded in bytes, subscription id, and callback gas limit as parameters. Then, it sends the request to the router by calling the FunctionsClient.sendRequest function. Note: This function is helpful if you want to encode a request offchain before sending it, saving gas when submitting the request. * fulfillRequest to be invoked during the callback. This function is defined in FunctionsClient as virtual (read fulfillRequest [API reference](#)). So, your smart contract must override the function to implement the callback. The implementation of the callback is straightforward: the contract stores the latest response and error in s_lastResponse and s_lastError before emitting the Response event.

s_lastResponse = response; s_lastError = err; emit Response(requestId, s_lastResponse, s_lastError);

JavaScript example

source.js

The Decentralized Oracle Network will run the [JavaScript code](#). The code is self-explanatory and has comments to help you understand all the steps.

note

Functions requests with custom source code can use vanilla [Deno](#). Import statements and imported modules are supported only on testnets. You cannot use any require statements.

It is important to understand that importing an NPM package into Deno does not automatically ensure full compatibility. Deno and Node.js have distinct architectures and module systems. While some NPM packages might function without issues, others may need modifications or overrides, especially those relying on Node.js-specific APIs or features Deno does not support.

This JavaScript source code uses [Functions.makeHttpRequest](#) to make HTTP requests. To request the BTC asset price, the source code calls the [https://pro-api.coinmarketcap.com/v1/cryptocurrency/quotes/latest/URL](#). If you read the [Functions.makeHttpRequest](#) documentation, you see that you must provide the following parameters:

- url: https://pro-api.coinmarketcap.com/v1/cryptocurrency/quotes/latest
- headers: This is an HTTP headers object set to "X-CMC_PRO_API_KEY": secrets.apiKey. The apiKey is passed in the secrets, see [request](#).
- params: The query parameters object:

```
{ convert: currencyCode, id: coinMarketCapCoinId }
```

To check the expected API response, run the curl command in your terminal:

```
curl -XGET "https://pro-api.coinmarketcap.com/v1/cryptocurrency/quotes/latest?id=1&convert=USD" -H 'accept: application/json' -H 'X-CMC_PRO_API_KEY: REPLACE_WITH_YOUR_API_KEY'
The response should be similar to the following example:
```

```
{
  "data": {
    "1": {
      "id": "1",
      "name": "Bitcoin",
      "symbol": "BTC",
      "slug": "bitcoin",
      "quote": {
        "USD": {
          "price": 23036.068560170934,
          "volume_24h": 33185308895.694683,
          "volume_change_24h": 24.8581,
          "percent_change_1h": 0.07027098,
          "percent_change_24h": 1.79073805,
          "percent_change_7d": 10.29855
        }
      }
    }
  }
}
```

01-26T18:27:00.000Z"]}}}} The price is located at data,1,quote,USD,price.

The main steps of the scripts are:

- Fetch the currency code and coin market cap coin id from margs.
- Construct the HTTP object coinMarketCapRequest using Functions.makeHttpRequest.
- Make the HTTP call.
- Read the asset price from the response.
- Return the result as a [buffer](#) using the helper function: Functions.encodeUint256. Note: Because solidity doesn't support decimals, we multiply the result by 100 and round the result to the nearest integer. Note: Read this [article](#) if you are new to Javascript Buffers and want to understand why they are important.

[request.js](#)

This explanation focuses on the [request.js](#) script and shows how to use the [Chainlink Functions NPM package](#) in your own JavaScript/TypeScript project to send requests to a DON. The code is self-explanatory and has comments to help you understand all the steps.

The script imports:

- [path](#) and [fs](#): Used to read the [source file](#).
- [ethers](#): Ethers.js library, enables the script to interact with the blockchain.
- @chainlink/functions-toolkit: Chainlink Functions NPM package. All its utilities are documented in the [NPM README](#).
- @chainlink/env-enc: A tool for loading and storing encrypted environment variables. Read the [official documentation](#) to learn more.
- [./abi/functionsClient.json](#): The abi of the contract your script will interact with. Note: The script was tested with this [FunctionsConsumerExample contract](#).

The script has two hardcoded values that you have to change using your own Functions consumer contract and subscription ID:

const consumerAddress = "0x8dF78B7EE3128D00E90611FBED20A71397064D9"// REPLACE this with your Functions consumer address
const subscriptionId = 3// REPLACE this with your subscription ID
The primary function that the script executes is makeRequestMumbai. This function can be broken into six main parts:

1. Definition of necessary identifiers:
2. routerAddress: Chainlink Functions router address on Polygon Mumbai.
3. donId: Identifier of the DON that will fulfill your requests on Polygon Mumbai.
4. gatewayUrls: The secrets endpoint URL to which you will upload the encrypted secrets.
5. explorerUrl: Block explorer url of Polygon Mumbai.
6. source: The source code must be a string object. That's why we use fs.readFileSync to read source.js and then call toString() to get the content as a string object.
7. args: During the execution of your function, These arguments are passed to the source code. The args value is ["1", "USD"], which fetches the BTC/USD price.
8. secrets: The secrets object that will be encrypted.
9. slotIdNumber: Slot ID at the DON where to upload the encrypted secrets.
10. expirationTimeMinutes: Expiration time in minutes of the encrypted secrets.
11. gasLimit: Maximum gas that Chainlink Functions can use when transmitting the response to your contract.
12. Initialization of ethers signer and provider objects. The signer is used to make transactions on the blockchain, and the provider reads data from the blockchain.
13. Simulating your request in a local sandbox environment:
14. Use simulateScript from the Chainlink Functions NPM package.
15. Read the response of the simulation. If successful, use the Functions NPM package decodeResult function and ReturnType enum to decode the response to the expected returned type (ReturnType.uint256 in this example).
16. Estimating the costs:
17. Initialize a SubscriptionManager from the Functions NPM package, then call the estimateFunctionsRequestCost function.
18. The response is returned in Juels (1 LINK = 10**18 Juels). Use the ethers.utils.formatEther utility function to convert the output to LINK.
19. Encrypt the secrets, then upload the encrypted secrets to the DON. This is done in two steps:
20. Initialize a SecretsManager instance from the Functions NPM package, then call the encryptSecrets function.
21. Call the uploadEncryptedSecretsToDON function of the SecretsManager instance. This function returns an object containing a success boolean as long as a version, the secret version on the DON storage. Note: When making the request, you must pass the slot ID and version to tell the DON where to fetch the encrypted secrets.
22. Making a Chainlink Functions request:
23. Initialize your functions consumer contract using the contract address, abi, and ethers signer.
24. Call the sendRequest function of your consumer contract.
25. Waiting for the response:
26. Initialize a ResponseListener from the Functions NPM package and then call the listenForResponseFromTransaction function to wait for a response. By default, this function waits for five minutes.
27. Upon reception of the response, use the Functions NPM package decodeResult function and ReturnType enum to decode the response to the expected returned type (ReturnType.uint256 in this example).
