

Hello guys,

For the purpose of my end of study project as a computer engineer, i have an e-government project, which is about governemental auctions with ethereum.

I have builded my smart contracts : AuctionFactory which deploy an auction with function "createauction()", i just want to run the function "endauction()" which computes the winner of an auction in the new enigma discovery network , and also i want to encrypt the bid data from my front end which is written in angular js.

Is it possible with the actual new discovery version ? Could anyone help me, I am a little bit out of time for my project so it would be great if some one could help me or advise me.

Thanks guys.
