

SPL Wallet

Before you get started using Raydium, you'll need a Solana Program Library (SPL) wallet for storing your funds on the Solana blockchain and for interacting with the Raydium Program. Don't forget to fund your wallet with SOL, as it is required to execute a transaction on the Solana network. It is recommended to keep a minimum of 0.05 SOL in your wallet to avoid failed transactions. Raydium supports many wallets including those recommended below.

Web Wallet:

[Phantom](#) offers a wallet and browser extension with a streamlined, user-friendly interface. Raydium highly suggests Phantom for new users and those that want a simple and straightforward wallet experience. [Solflare](#) is another digital wallet that enables universal access to the Solana blockchain and its associated applications. Solflare offers both a browser extension wallet and a web-page based wallet, the latter being particularly handy to monitor transactions history. [Backpack](#) is an intuitive next-generation browser extension allowing users to import SPL and ERC-20 addresses in the same wallet. Minting executable NFTs known as xNFT on Backpack allows users to access dApps natively in a single interface.

Mobile Wallets: If you are accessing Raydium through your mobile device you can get started by using the Phantom or Solflare wallets available on both [IOS](#) and [Android](#) . Note that you can import your 12 or 24 word seed phrase used on your wallet extension to import your wallet to a mobile device.
