

ApertureSwap on Manta Pacific L2

An introduction to Aperture's V3 style concentrated liquidity DEX on Manta Pacific.

The Basics

What is ApertureSwap?

ApertureSwap is a fully functional concentrated liquidity DEX on Manta Pacific (more networks coming soon) that is modeled after Uniswap V3. However, unlike Uniswap V3 this DEX will come with several native LP automation features and native solutions for limit and range orders!

What is Manta Pacific?

Manta Pacific is a Zero Knowledge Ethereum Layer 2 built using a modified OP Stack (which also powers Coinbase's BASE chain and A16z's Magi chain). What separates Manta Pacific from various other ZK chains or OP Stack L2's is its out of box solution for ZK app developers — called “universal circuits”. These circuits will save developers substantial time to ship a ZK enabled application. Read more about “universal circuits” from the Manta team [here](#) .

More Information

For more information on the concentrated liquidity DEX that ApertureSwap is modeled after we recommend checking out Uniswap's documentation. <https://docs.uniswap.org/concepts/protocol/concentrated-liquidity>
