

Gauntlet USDC.e Migration Risk Dashboard

Gauntlet is excited to publicly release our [risk dashboard](#) providing insight into native USDC & bridged USDC.e. This dashboard was built to be a reference point throughout Aribtrum's initiative to migrate liquidity into native USDC. The dashboard covers TVL distribution for both USDC & USDC.e by token across Aave, GMX, Uniswap, and Radiant; information on liquidity depth; and active account information.

Dashboard Summary

The TVL Share by Token pie chart shows the breakdown of USDC vs. USDC.e TVL across the entire Arbitrum ecosystem. For both USDC.e & USDC, the leading protocols that hold the tokens are listed.

[

TVL Share by Token

1108×828 57.4 KB

](<https://global.discourse-cdn.com/standard17/uploads/arbitrum1/original/2X/3/3f920339a8ee0c69bbc2bd127c439c028e85bd56.png>)

We also provide an area chart breaking down the TVL per protocol over time for both USDC & USDC.e

[

TVL Share by Protocol

2274×864 46.3 KB

In regards to trading information, we provide both the 2% price impact & the trading activity. 2% price impact shows what size of trade would be needed to cause a price impact of 2% based on the liquidity available onchain. The trading activity bar graph shows how much of each token was traded on a per-day basis.
