

Bridge Native Assets with Etherscan

How to bridge native assets from ETH and Matic to Celo with Etherscan.

Call the EthHelper

Navigate to the [Etherscan](#) (or [Polygonscan](#)) page for the EthHelper.

- On Ethereum
- On Polygon

Ethereum EthHelper Address = [0x2784a755690453035f32Ac5e28c52524d127AfE2](#) Polygon EthHelper Address = [0xa489b8981ae5652C9Dd6515848cB8Dbecae5E1B0](#) * Open the Write Contract * pane > connect your wallet * > then select sendToEVMLike * * Optics is designed to support multiple non-EVM chains * * This function helps you send ETH to another chain that uses EVM-style addresses

- ForpayableAmount
- enter the amount you'd like to send in ETH.

tip 1 wei = 1 / 10 ** 18 ETH. * For_domain * , enter the domain ID of the chain to which you'd like to send tokens.

Domain IDs are like phone numbers. They represent the chain you're going to call.

- On Celo
- On Polygon
- On Ethereum

Celo Domain ID = 1667591279 Polygon Domain ID = 1886350457 Ethereum Domain ID = 6648936 * For_to * , enter the address of the recipient on the destination chain. * Select write * > sign the transaction * > then send * it to the network.

Wait

Wait for a moment for your transaction to finalize on the network. [Edit this page](#) [Previous Celo Bridges](#) [Next Bridge Tokens with Etherscan](#)
