

I'm aware there's a feedback page for this but I think it's important to post it here since we have Unlimited being released any time now, and I think anyone interested in the protocol should be aware of just how unready DYDX is to release prediction markets to the public

I felt like betting on Trump yesterday and opened long positions on seven different accounts with some play money. Here's what happened:

- the max allowed leverage was around 1.15x to 1.30x (which completely defeats the purpose of leverage trading, you might as well bet directly on Polymarket and avoid paying funding fees)
- out of the seven accounts, five of them got 'deleveraged,' meaning the protocol closed my positions at about \$0.75, which means I lost about 33.33% in profit that I would have made if Trump had hit \$1, which he eventually did since he won. The bizarre thing here is:
- I was hardly leveraged (remember, the max allowed leverage was around 1.15x to 1.30x)
- there were hardly any price wicks yesterday (which is when I got deleveraged)
- it seems completely random that five accounts got deleveraged, while two didn't. I opened all positions minutes apart on each account with the same max allowed leverage of 1.15x to 1.30x. The only difference is that some of the accounts had slightly larger positions than others

is this really what we're about to release at scale? Can we get some feedback on what happened here and any planned improvements to ensure this is ready for launch
