

As the Aztec Labs team makes progress on developing the Aztec network and the number of teams and developers working on the network grows, it would be helpful to formalize the process about how ideas go from discussions to specifications. This would also be helpful for creating and maintaining the single source of truth for specs, community processes, and other Aztec standards, similar to how the EIP process does this for Ethereum.

[Here](#) is a proposal for that process. Feel free to comment directly in the document with questions or ideas or reply in this thread.

This proposal is heavily inspired by the [EIP process](#) used by Ethereum, but aims to be lighter-weight while the Aztec community is smaller and easier to coordinate. This process can be expanded upon and refined in the future—this is merely a starting point.
