

In response to the [Call to Action - Ecosystem Actors <> SubDAOs 4] encouraging Ecosystem Actors to promote their services to SubDAOs to foster an active ecosystem environment, Ubiquity DAO is submitting DevPool for your consideration and integration into the MakerDAO Community.

DevPool is a crypto-native platform that organically sits on top of GitHub to optimally match developers with open tasks and get paid in crypto while automating the administrative components for DAOs and repository maintainers.

DevPool allows developers to find and get paid for jobs they are interested and qualified in while allowing project managers to outsource tasks to qualified talent on demand.

Being purpose-built on top of Github, DevPool retains an open source ethos with a focus on increasing operational efficiencies, accountability, and maintaining transparent community building that are all the cornerstones of the Ethereum developer ecosystem.

(I had issues uploading media, including a video, here so we decided to host this post on our website.)
