

Workspaces

Workspaces are dedicated areas for individual users where they can create deployments, and every action, along with its executions and metadata, is stored. These spaces serve as personalized environments for managing and organizing workflow components. In a workspace, users can craft and oversee their deployments, track the performance and outcomes of each action, and access all associated metadata.

This facilitates efficient workflow management and provides a comprehensive view of all activities and their corresponding data within the user's domain.
