

I have an idea of creating a new stETH token, using the Rocket pool Node Operator instead of the normal ETH staking.

This would add 15%ETH(+RPL) rewards, while not adding that much risk compared to stETH?

You can still take a fee for like 10% of the rewards, this will benefit both Lido and Rocket pool, since rocket pool are in need of more Node Operators and are now providing constant 15% extra ETH to node operators.

Are there any big risks or reason not to do this?
