

Hey all, our team SNTL (Sentinel) recently launched a DAPP to trade esGMX. When working with GMX accounts we noticed having an auto-compounding reward tool is possible working off existing architecture. Users could customize and control parameters such as...

- How often to compound
- Auto convert ETH earnings to GMX (and stake)
- Unstake + sell in 1 tx
- Can tokenize (create an NFT) of your account by adding account into your SNTL vault and creating an NFT for the vault that represents ownership. Vault can be detokenized at any time

Posting this to gauge interest, would be happy to get this done and get a fully finished product (smart contracts + front end) up that's audited for 1k GMX + marketing support for the tool when launched. This 1k GMX would cover the cost of audit + dev work both smart contract + front end (a team of 4)

To see the quality of work that would be delivered you can view our recently built esGMX product <https://sntl.market/>

Code for the esGMX DAPP: [GitHub - SentinelDev1/SNTL-Market](#)

We would ask for a small fee for use of the vault that would be shared with GMX holders, in addition to SNTL team to cover ongoing maintenance and dev work after the tool is launched.
