

What do you think about a cross chain safety module or simply deployed on each chain to allow everyone to be able to protect Aave not only on ethereum but on polygon, avalanche, harmony, etc ... and generate % for that but not only on ethereum mainnet ?

Or imagine a cross-chain safety module, where it is possible to deposit Aave against XstkAave and generate interest on the chain or another chain ?

Moreover a pool like the 80 aave/ 20 eth pool (balancer) on ethereum with possibility of stake (stkAbpt) on other chains would be interesting too.

Since there is a lot of liquidity and Aave tokens on different chains I think it could be interesting

I don't know the technical difficulty nor the constraints but I want to open the debate

Thanks
