

Hi, this is my first post in the forum, I just heard about the Atzec project.

One of the main privacy concerns while building a secure app using solidity is the private key management. I have found this to be a major roadblock on Ethereum.

As I have given this a lot of thought, I would like to keep this question as simple as possible:

- Is it possible (or would it be possible) to share private keys via Aztec network ?

Looking forward to your answer(s).

THANK YOU!
