

Transfer USDC on devnet between Solana and other chains

Explore this tutorial for transferring USDC between Solana devnet and other testnets[Suggest Edits](#)

To get started with CCTP on Solana devnet, follow the example scripts provided [here](#) . The examples use [Solana web3.js](#) , [Anchor](#) , to transfer USDC to and from an account on Solana devnet and an address on an external blockchain.

As a security measure, these scripts should only be used for devnet testing. It is not recommended to reuse private keys across mainnet and devnet. Updated 7 days ago
