

hi all, I am pushing this one up a bit again. Unfortunately the proposal at CoE for an 'official' compute which works for non-AWS cloud providers or local compute didn't take off but I verified this weekend that the Oracle Compute as documented in the github link above still works and also for daily compute. Since there are no cost involved, you can easily get started with this one (provided that you have some experience in admin and programming ofcourse). Have fun!
