

Hi,

Apologies if this has been asked before. Is there functionality available in the current release to submit a task to the Enigma network and get the results within a method in the secret contract, as opposed to doing this from the client side with web3? If this isn't the case, will it be available in the next release? I'd like this primarily for passing the current block number to the Enigma callable, as well as for checking the message sender before executing the callable.
