

## Summary

:

We just completed a synchronized merge to the master branches of our three main repositories: contract ([PR#124](#)), core ([PR#201](#)) and p2p ([PR#196](#)). This automatically pushes new docker images that the [discovery-cli](#) use, as well as a new release of the EnigmaJS

client library (version 0.0.8

).

## How to upgrade

:

You need to do three things:

- Pull the new docker images via discovery pull
- Upgrade your discovery-cli

install: `npm install -g @enigmampc/discovery-cli@0.0.25`

- Inside your project folder (where you first ran discovery init

), install the new EnigmaJS

npm package via `npm install enigma-js@0.0.8`

Should you upgrade?

:

While there should not be perceptible changes from your dApp developer point of view and what you interact with, we highly recommend that you upgrade to run on the most similar version of the Enigma version to what will be our public release. Expect upgrades like this with a manageable frequency (about once a month or less) that we encourage you to act on them.

What you should NOT do

:

You either run all steps described above, or run none. Running only one will introduce breaking changes.
