

Many of us hodlers has a bag of \$ARB token and has no where to put them except LP. LP are risky and doing LP at this low price feels like selling \$ARB. Yet, having tokens sitting in the wallet doing nothing feels very weird. What if we utilize a little amount of \$ARB in the DAO treasury to create a temporary staking contract (~3 months), so that token holders can have a place for their tokens to do work for them, meanwhile we figure out how to form the DAO and make it work.

Take ETH staking as an example, assume 20% of token holders will stake their tokens, and earn an APY of 4%, and the staking incentives last for 3 months, token required will be:

$$1.275B \times 20\% \times 4\% \times 0.25 = 2.55 \text{ Million tokens}$$

Which is only 25% of that sold by the foundation, seems fair?
