

## Installing CometBFT

Follow [these instructions](#) in order to setup CometBFT.

## Installing GLIBC

Finally, you should have GLIBCv2.33 or higher.

MacOS : the system-provided glibc should be recent enough.

Ubuntu 22.04 : glibc is installed by default and you don't have to do anything more.

Ubuntu 18.04 and Ubuntu 20.04 : glibc has v2.27 and v2.29 respectively, by default which is lower than the required version to run Namada. We recommend to directly [install from source](#) or upgrade to Ubuntu 22.04, instead of updating glibc to the required version, since the latter way can be a messy and tedious task. In case updating glibc would interest you, this [website \(opens in a new tab\)](#) gives you the steps to build the package from source.

[Using the binaries Docker](#)
