

The Dark DAO proxy-voting attack has [come up before on here](#)... We just posted an article that summarizes the attack and brainstorms a few responses: <https://medium.com/@leor.fishman/fc3b4fe4d666>

In summary, a few open questions:

- Is generating keys under SGX hardware a feasible response?
- How can this be made more accessible — perhaps through a plurality of TEE solutions or creating compatibility with TEEs in mobile devices?
- Are there potential transaction-level proofs to these attacks?
