## March of the Tokemechs

Q1 of 2022 kicked off the beginning of Tokemak's official liquidity deployment. Since the start of the year, we have:

- Launched the 'pro mode' exchange voting UI for Liquidity Directors
- Begun preliminary liquidity deployment to Curve pools
- Several iterations of dApp / website updates and improvements
- Released two audits, one by Omniscia and another by Trail of Bits (both live now in the [tokedocs](#))
- Launched the new TOKE staking contract to prepare full liquidity direction
- Migrated to weekly Cycles, in preparation for full liquidity direction

This initial phase of liquidity deployment has been an intentional slow rollout of funds with the intention to scale gradually, and into different types of liquidity provision (stable pools, then ETH pairs, then full system deployment). At the time of writing, Tokemak has \$370M worth of assets deployed to various Curve/Convex pools, including our tABC/ABC pools from Token Reactors. In addition to the tABC/ABC pools allowing users to quickly enter and exit tAsset positions without waiting for a Cycle conclusion, the Curve/Convex deployments are part of a larger strategy which was teased in the Leaky Reactor this past Sunday. You can read snippets of the strategy found on Tokemach Captain Tratum's Tokebase Leaky Sundays coverage [here](#).

To shine some light on what's coming next for the pilots following along, we want to give a rough outline of the next few weeks/months. Note: some of these dates are moving targets and approximations, so think of this as a targeted flight path rather than a "roadmap."

## Mech Flight Path and Upcoming Milestones:

### SushiSwap / Uniswap v2 DEX Liquidity

At the start of this week's new Cycle (starting tomorrow, March 9th), liquidity from Token Reactors will begin flowing to SushiSwap and Uniswap v2 based on Liquidity Director votes and certain guard rail parameters. Please note, this will be a first-drip amount and not full-scale deployment of all Reactors. We'll make an announcement tomorrow regarding the selected pools for deployment that meet these preliminary guardrails and the logic for said guardrails.

As seen on the Linear timeline screenshot above, we're then planning to increase further DEX deployment the following few weeks in a continuation of safe scaling and careful evaluation. Make no mistake, this is a major milestone in Tokemak's progress and the beginning of the first real display of its intended design.

Timeline

: Tomorrow, March 9th / Scaling more liquidity March 16th / further scaling March 23rd
