

# Axelar command-line interface (CLI)

Some CLI commands require access to a fully synced Axelar node. Learn how to [start your own Axelar node](#).

Some CLI commands require AXL tokens to pay for on-chain transaction fees. Get testnet AXL tokens from the Axelar faucets: [testnet](#).

Use the Axelar CLI to execute cross-chain token transfers:

- [Send UST to an EVM chain](#)
- [Redeem UST from an EVM chain](#)
- [Send AXL to an EVM chain](#)
- [Redeem AXL from an EVM chain](#)

In addition to the Axelar-specific CLI features mentioned above, Axelar also offers the same basic set of CLI commands as any other Cosmos SDK project.

View the [full CLI documentation](#) for the latest node version, or choose a specific version:

Tip: If you submit a transaction and encounter an out of gas error, use the following flags to set the gas manually.

## --gas

auto --gas-adjustment= 1.5 Bash Copy [Edit this page](#)
