

GM! I created a tool to help keep users up to date in web3. For example, this is the newsfeed for Uniswap: <https://app.x23.ai/uniswap>. It covers governance discussions, snapshot votes, github PRs, and github code repositories.

We use AI to summarise and give context to the information, among other things.

I'd love to hear any feedback and how I can make this more useful and specific for Uniswap. For example, the Senate proposal notifications are currently broken, and notifications is something we already have implemented that could be re-tooled for this forum.
