

Hi! I'd like to propose a Committee for Audits and Testing, meant to augment the development committee with people who've demonstrated skills at redteaming code/protocols to audit and set testing standards for secret contracts so we avoid/minimize events like the past few days.

I'll start with my relevant creds:

1. I've been redteaming crypto work semi-informally for the past 3 years, the way I first got in touch with the SN team was redteaming the MPC protocol, I've got credits for finding holes in other protocols too (in particular some safetrace holes, some Novid holes, I've got a citation in the apple/google repos for it, etc).
2. I've been running engineering teams for 3 years, during which time much of my work was CRing/setting testing and devops standards for the teams I was on.

I'd want others to join me in this (I've got time to run things like 5-10 hrs a week at most, not enough time to be FTE), but I'm mainly putting this out there to gauge interest
