

I am pleased to present to you my project — the web3 game [Elicia Online https://elicia.io](https://elicia.io). This exciting game combines elements of medieval fiction and the cryptocurrency economy. In Elicia, players can create their own unique characters and embark on an exciting adventure full of battles, exploration, trading, crafting and competition.

One of the key elements of the game is resource extraction. Players can collect various materials such as wood, leather, ore and herbs, which will become the basis for creating powerful weapons, armor, potions and other useful items. These items can be exchanged with other players or used to improve the characteristics of your character.

All transactions in Elicia are carried out through cryptocurrencies ETH, BNB, POL or AVAX, as well as through the exchange of resources extracted in the game for others. There is no commission for transfers between players, however, gas fees may be charged for transactions.

Elicia Online is a world full of exciting events and opportunities. Here you can enjoy the exciting gameplay, as well as earn money through the referral system and the sale of game items.

I am currently planning to implement the Arbitrum system into the game, which will significantly expand the transaction capabilities and improve the gameplay.

I would be glad to hear your assessment of my project and your suggestions for the further development of Elicia Online.
